

Ep: 3 Assignment Answers

1. What is JSX?

-> 1. JSX is JavaScript XML, It is HTML like code.

2. It is not a part of React, It is developed by facebook to write code easily, reduce complex code structure. Without JSX we can also create an elements and Components

2. Superpowers of JSX

-> 1. It sanitizes the Data.

2. Make code look more readable and cleaner.

3. Show more useful warnings and Errors.

3. Role of type attribute in script tag? What options can I use there?

-> The “type” attribute in the <script> tag specifies the type of script

Or data the browser should interpret.

Common values are: 1. “text/javascript” → normal JavaScript.

2. “module” → ES6 modules using import/export.

3. “application/json” → store JSON data.

4. “importmap” → define module import mapping.

4. {TitleComponent} vs {<TitleComponent/>} vs

{<TitleComponent></TitleComponent>} in JSX

- ➔ 1. {TitleComponent} : This is means using TitleComponent to execute the Function of itself. Or we can say TitleComponent referring itself.
- 2. {<TitleComponent/>} : This is means Render the Component.
- 3. {<TitleComponent></TitleComponent>} : This is same as the {<TitleComponent/>} just written in opening and closing tag format.
